

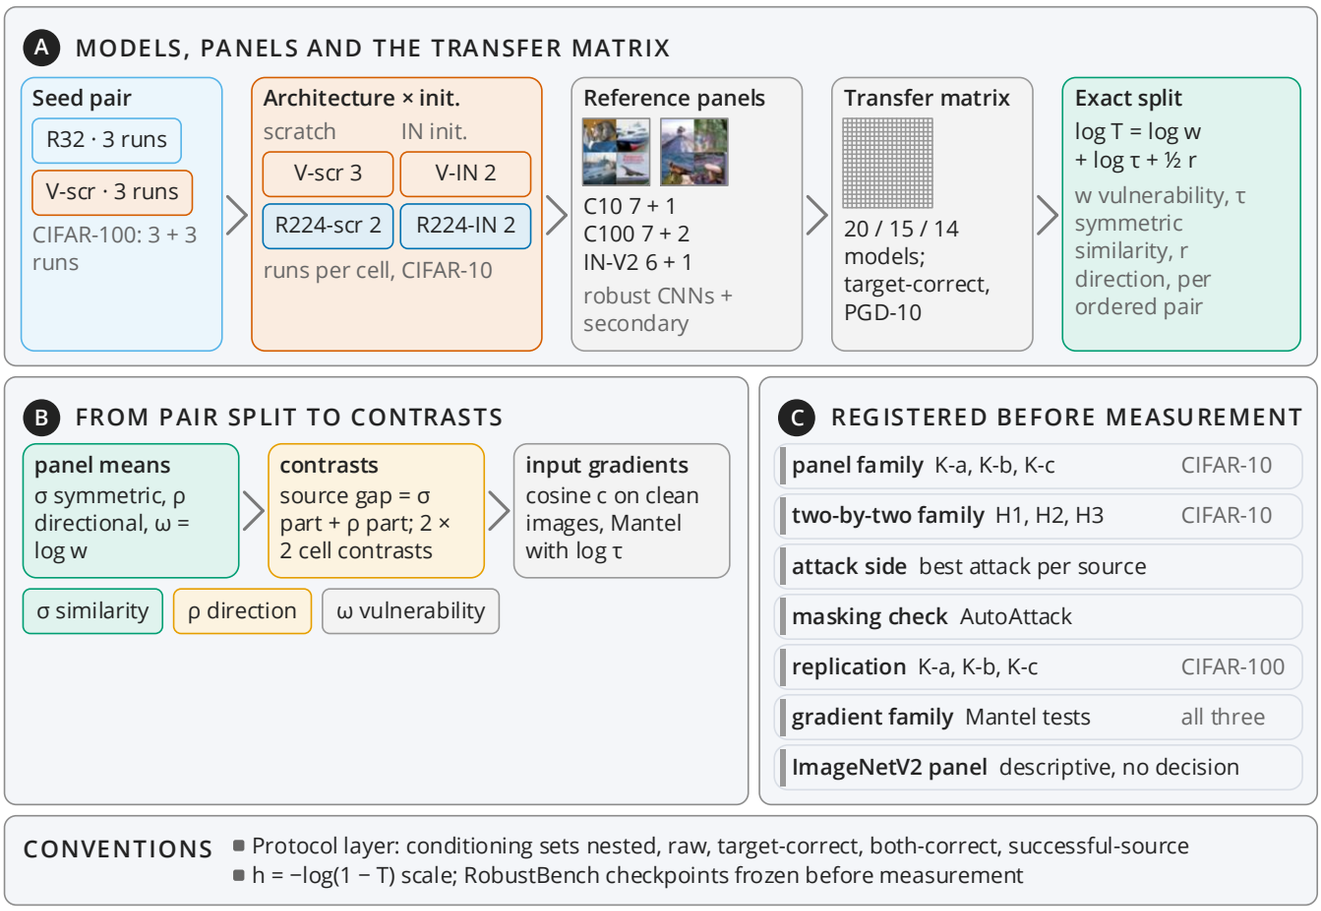

Figure 1. Study overview. A ResNet-18 and ViT-Tiny pair and a two-by-two architecture-by-initialization design are evaluated against fixed panels of robust CNNs on CIFAR-10 and CIFAR-100, with a descriptive extension to independently trained ImageNet models on ImageNetV2. Transfer rates are factored into vulnerability w, symmetric similarity $\bar{\tau}$ and directional residual r; the registered test families and the conditioning-protocol layer appear at the bottom.
